

Abstract Of The Disclosure

5 A foldable extension for an unloading door of
a cotton receiving receptacle of cotton harvester which,
when in a deployed position, increases the overall
length of the door and directs cotton conveyed over the
extension in a downward direction so as to facilitate
more precise placement in a receiving receptacle. The
extension does not have to be folded to its stored
10 position each time the unloading door is closed, and
when folded into its stored positions, does not increase
the overall height of the harvester or interfere with
telescopic operation of upper and lower portions of the
basket.
